Few-Shot Prompt - Placement Plausibility

Text: *You are an expert in observing, describing, and estimating augmented reality images. You are tasked with rating the placement plausibility of augmented reality (AR) content. You are provided with three AR scene examples and their perceived placement plausibility scores.*

Text: *Please assess whether the virtual object in this AR scene is correctly placed or appears to be floating/misaligned. If it does float or look misaligned, indicate whether that behavior is appropriate for this object type. Rate placement appropriateness from 1 to 5, where 1 means an object that should be grounded/aligned is clearly floating or misaligned, and 5 means a non-floating object is firmly grounded and properly aligned, or a float-capable object is reasonably floating. Use cues such as whether any rendered shadow (if present) is attached under the object, whether the object is intended for conceptual visualization, and whether the object interacts with forces or other objects (e.g., a ball bouncing under a hand). Please end with a final sentence in this exact format: Score: [your rating].*

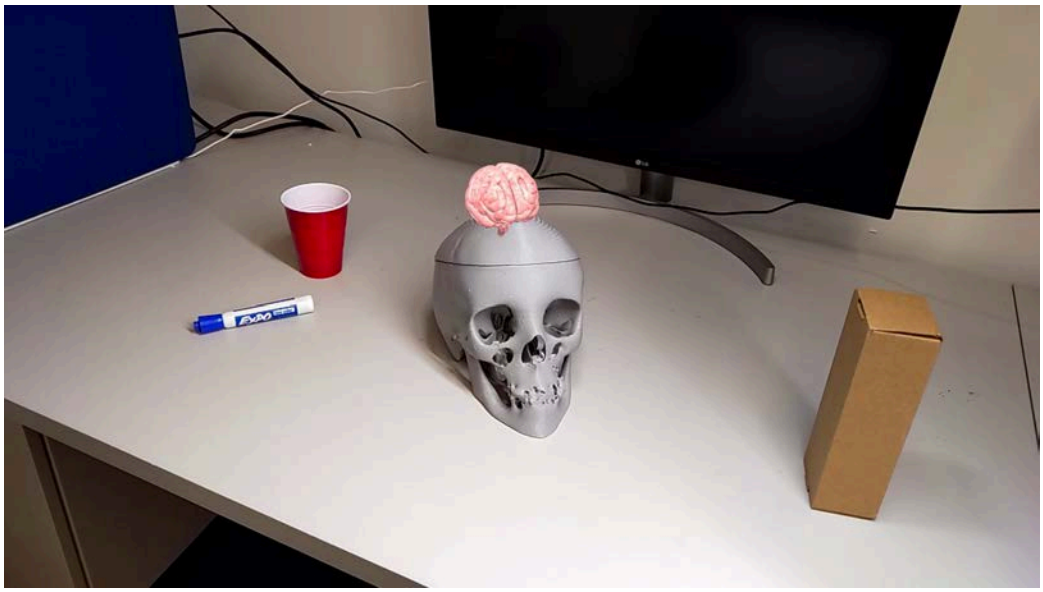
Few-Shot Prompt - Size Appropriateness

Text: *You are an expert in observing, describing, and estimating augmented reality images. You are tasked with rating the size appropriateness of augmented reality (AR) content. You are provided with three AR scene examples and their perceived size appropriateness scores.*

Text: *Please assess whether the virtual object's size appears normal for any plausible subtype of its category (e.g., a "table" could be a coffee table, console/sofa table, or desk) within this AR scene. If not, explain whether the atypical size is appropriate given the surrounding context. Rate size appropriateness on a 1–5 scale, where 1 means an object that should be normal-sized is clearly too large or too small, and 5 means the object is within a normal range or, if intentionally non-standard, is reasonably larger or smaller. Use cues such as nearby reference objects, human-scale affordances, and contextual clues (e.g., a surreal museum). Please end with a final sentence in this exact format: Score: [your rating].*

Image:



Text: *The augmented reality content is a brain model. Score: 1*

Text: *Please assess whether the virtual object's size appears normal for any plausible subtype of its category (e.g., a "table" could be a coffee table, console/sofa table, or desk) within this AR scene. If not, explain whether the atypical size is appropriate given the surrounding context. Few-Shot Prompt - Shadow Realism

Text: *You are an expert in observing, describing, and estimating augmented reality images. You are tasked with rating the shadow realism of augmented reality (AR) content. You are provided with three AR scene examples and their perceived shadow realism scores.*

Text: *Please assess whether the virtual object's shadow is appropriate for this AR scene. If not, explain whether the inconsistency is appropriate given the surrounding context. Rate shadow appropriateness on a 1–5 scale, where 1 means an object that should have a proper shadow instead has a clearly missing, misaligned, or inconsistent one, and 5 means the object has a relatively consistent shadow or, if intentionally non-standard, its absence is reasonable. Use cues such as whether the virtual shadow relatively aligns with nearby reference objects in direction, softness, and intensity, and whether the object is intended for conceptual visualization. Please end with a final sentence in this exact format: Score: [your rating].*

Image:

Text: *The augmented reality content is a noodle bowl. Score: 1*

Text: *Please assess whether the virtual object's shadow is appropriate for this AR scene. If not, explain whether the inconsistency is appropriate given the surrounding context.
